HARI PRASATH RAMAN

New York, NY

https://www.linkedin.com/in/hariprar hraman@cs.stonybrook.edu · https://github.com/rhp4515

EDUCATION

M.S. Computer Science
Stony Brook University · CGPA 3.96/4 · Dec 2016

B.Tech. Computer Science & Engineering
NIT Tiruchirappalli · CGPA 8.5/10 · 2009 — 2013

TECHNICAL SKILLS

- **Languages:** Python, C++20, TypeScript, JavaScript, Bash
- **Protocols:** FIX, REST / OpenAPI, BLPAPI, SSE
- **Middleware:** Kafka, RabbitMQ, Celery, SaltStack
- **Frameworks:** Flask, Django, React
- **Practice:** People-first leadership, API platform strategy, observability-driven design, AI-assisted engineering, TDD / BDD

WORK EXPERIENCE

Bloomberg *Mar 2017 – Present*
Engineering Manager *New York*

- **Scope:** Own the unified FIX / REST / BLPAPI ingestion platform through which client trade and order workflows enter the firm — client-facing, real-time, held to enterprise standards of correctness, reliability and performance.
- Led a multi-year live-traffic migration that turned the platform into a pure infrastructure layer — buyside/sellside ticketing logic handed to the owning domain teams, the monolith broken into microservices — with no client impact.
- Re-architected trades/orders ingestion: 5 → 300 msg/s, 50 → 1,000+ orders per basket, 1M+ transactions a day across buyside and sellside workflows.
- Took on a second team before a capacity gap hit; protected its real-time downstreams with backpressure and client rate limiting, and built the case for added headcount by tying its roadmap to the org's API-first strategy.
- Drove a shared Pub/Sub platform capability out of competing SSE APIs — OpenAPI and Kafka contracts agreed before implementation so consumers could validate early.
- Made "catch it before the client does" a team-wide operating principle — disciplined logging, health dashboards from application and middleware metrics, AI-assisted issue detection, and a support-first triage path with a chatbot that keeps resolvable issues off engineering's plate.
- Directed the Solaris → Linux migration at DR-1 (99.9%+ uptime, latency halved, monthly → weekly releases, errors −30%) and was among the first to move apps from bare metal to VMs ahead of the cloud move.
- Drove AI adoption with a concrete plan for every engineer to build it into daily work — which kept the migration on schedule despite scope added along the way.
- Every intern/co-op project I've sponsored has shipped as a critical-pipeline component: a traffic-capture system now used to stress-test new apps and guide feature decisions, a migration-burndown widget for senior leadership, and a Flink-based field-usage observability pipeline (in progress).
- **Team:** 10 engineers · 6-for-6 on team-matching hires · onboarding ramp 3 months → 1, new grads on production work from day one · TDD/BDD default · three senior engineers now lead areas independently

Senior Software Engineer *Apr 2019 – Feb 2022*

- Designed DataMapper, a configuration-driven translation framework serving 600+ requests per second with horizontal scale — one data dictionary instead of bespoke integrations.
- Built the self-service portal that let trading-system teams request and manage their own middleware configuration, retiring a queue of manual tickets.

Software Engineer *Mar 2017 – Apr 2019*

- Shipped SIMN, a workflow engine for data-centre operators to author, validate, execute and audit network maintenance runbooks — 60%+ gain in operator efficiency.
- Built a distributed reachability monitor with historical query APIs, letting alerting correlate application failures against device outages.

Whisper *Jun 2016 – Aug 2016*
Software Developer Intern *Venice CA*

- Reporting and anomaly-detection dashboards on Druid, plus an interface for managing Presto queries and automating Jenkins jobs for the data science and SRE teams.

Zynga *Jul 2013 – Jul 2015*
Software Engineer *Bangalore*

- Cut initial game load time 25% by preloading assets against player game state.
- Dynamic task generation tuned to player skill: engagement +15%, retention +20% across demographics.

RESEARCH EXPERIENCE

On the Performance Variation in Modern Storage Stacks
USENIX. File Systems Lab, Stony Brook (Prof. Erez Zadok).

SHS-HTTPS enforcer
ACM SIGSOFT SEN 38(6). Networks Lab, NIT Trichy (Prof. S. Selvakumar).
